

5:1 Low Input Voltage 9-45
Single Output
Metallic case - 1 500 VDC Isolation

- Ultra wide input range 9-45 Vdc
- 28Vdc input compliant with MIL-STD-704A/D/F
- Industry standard quarter brick package
- Power up to 200 W
- Wide temperature range : -40/+105°C baseplate
- High efficiency (typ. 92%)
- Soft start
- Galvanic isolation 1 500 VDC
- Integrated LC EMI filter
- Synchronizable
- Fully protected by independant security
 - Under voltage lock-out
 - Overvoltage protection
 - Current limitation protection
 - Overtemperature protection
- No optocoupler for high reliability
- RoHS process

1-General

The MGDM-205 low input series is a line of high density wide input range DC/DC power modules designed for aerospace, military and high-end industrial applications where high power density is a critical parameter. With 200W power, this DC/DC convert is particularly suitable for ultra compact power supply design. Standard models are available with ultra wide input voltage range of 9-45 volts. The series include single output voltage of 5 and 12 volts. The MGDM-205 low input series includes synchronization, trim and sense functions. The synchronization function allows to synchronize more than one converter to one frequency or to an external source frequency. All the modules are designed with LC network

filters to minimize reflected input current ripple and output voltage ripple.

The modules have totally independant security functions including input undervoltage lock-out, output overvoltage protection, output current limitation protection, and temperature protection. Additionnally a soft-start function allows current limitation and eliminates inrush current during start-up.

The design has been carried out with planar transformer and is manufactured in a fully automated process to guarantee high quality. The modules are potted with a state-of-the-art thermal conductive compound and used an insulated metallic substrat to ensure optimum thermal transfert under harsh environmental conditions.

2-Product Selection

Single output model : MGDS - 205 - - / -

Input Voltage Range

Permanent

H : 9-45 VDC

Output

C : 5 VDC

E : 12 VDC

Options :

/F : option for synchronization function

/T : option for -55°C start up operating temperature

/S : option for screening and serialization

Input range	Output	Current	Reference	Options	Suffix
9-45 VDC 9-45 VDC	5 VDC 12 VDC	40 A 16,65 A	MGDS-205-H-C MGDS-205-H-E	/F, /T, /S /F, /T, /S	

Converter Selection Chart

3- Block Diagram

The MGDM-205 DC/DC converter is based on a **constant** 330 KHz switching frequency forward topology designed for **wide input range**.

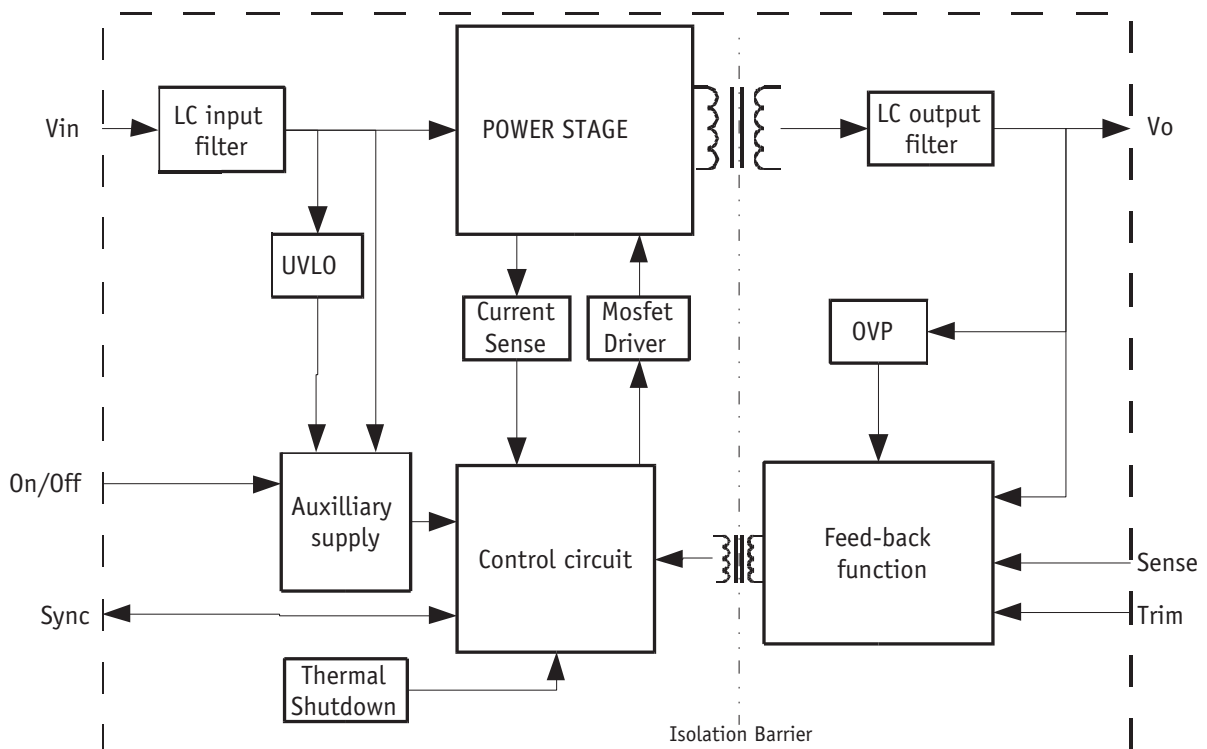

The output voltage sensed on the secondary side goes through a magnetic isolated feedback loop to avoid the use of optocoupler and by the way optimize **long-term reliability**.

An auxiliary supply is implemented to feed independently all safety functions such as the input undervoltage lock-out (UVLO), the output overcurrent protection (OCP), the output overvoltage protection (OVP) and the thermal protection (OTP).

The module features a **trim windows from -20% to +10%** of the nominal output voltage.

The main power transformer designed for more than 200W power is a multi-layer planar transformer which allows 100% reproductibility for optimized module efficiencies.

The controlled feedback regulation is located at the secondary side allowing a high regulation bandwidth and a very fast response to load changes.

4- Electrical Specifications

Data are valid at +25°C, unless otherwise specified.

Parameter	Conditions	Limit or typical	Units	Single Output MGDS-205 205 - H
Input				
Nominal input voltage	Full temperature range	Nominal	VDC	28
Permanent input voltage range (Ui)	Full temperature range	Min. - Max.	VDC	9 - 45
Transient input voltage	Full temperature range Full load	Maximum	VDC/ms	Consult factory
Undervoltage lock-out (UVLO)	Turn-on voltage Hysteresis	Maximum Maximum	VDC VDC	10,5 2
Start up time	Ui nominal, nominal output Full load : resistive	Maximum	ms	30
Reflected ripple current	Ui nominal, full load BW = 20MHz	Maximum	% Inom	10
No load input power	Ui nominal No load	Maximum	W	7
Standby input power	Ui nominal	Maximum	W	0,2
Shut down voltage	Enable voltage (< 0,05 mA) Disable voltage (< 0,5mA)	Minimum Maximum	VDC VDC	3,5 0,5
Output				
Output voltage *	Ui min. to max.	Nominal Nominal	VDC VDC	5 12
Set Point accuracy *	Ambient temperature : +25°C Ui nominal, 75% load	Maximum	%	+/- 2
Output power **	At max. baseplate temperature Ui min. to max.	Maximum	W	200
Output current 5V output 12V output	Full temperature range Ui min. to max.	Maximum Maximum	A A	40 16,6
Ripple output voltage *** 5V output 12V output	Ui nominal Full load BW = 20MHz	Typical Typical	mVpp mVpp	75 200
Output regulation * (Line + load + thermal)	10V. to Ui. max.* 0% to full load	Maximum	%	+/- 3
Efficiency		Typical	%	91%
Maximum admissible capacitive load 12V output	Ui nominal Full load	Maximum	μF	3 500
Output Voltage Trim	As function of output voltage	Minimum Maximum	% %	80 110

Note *: These performances are measured with the sense lines connected..

Note **: It is recommended to mount the converter on a heatsink for this test, see section 10 for further details.

Note ***: The ripple output voltage is the periodic AC component imposed on the output voltage, an aperiodic and random component (noise) has also to be considered.

It is recommended to add 4 external common mode decoupling capacitors (typically 10nF) connected between inputs and case and between outputs and case.

These capacitance should be layed-out as close as possible from the converter.

Note *: in transient mode (between Ui=9 and Ui=10Vdc the regulation performance may be degraded).

MGDS205HE Efficiency vs Output Power(W)

MGDS205HC Efficiency vs Output Power(W)

5- Switching Frequency

Parameter	Conditions	Limit or typical	Specifications
Switching frequency	Full temperature range Ui min. to max. No load to full load	Nominal, fixed	330 KHz

6- Isolation

Parameter	Conditions	Limit or typical	Specifications
Insulation class	Input ot output		Functionnal
Electric strength voltage	Input to output Input to case Output to case	Functionnal Minimum Minimum	1 500 VDC 1 500 VDC 1 500 VDC
Isolation resistance	500 VDC	Minimum	100 MOhm

7- Protection Functions

Characteristics	Protection Device	Recovery	Limit or typical	Specifications
Input undervoltage lock-out (UVLO)	Turn-on, turn-off circuit with hysteresis cycle	Automatic recovery	Turn-on nominal Turn-off nominal	see section 4
Output current limitation protection (OCP)	Hiccup circuitry with auto-recovery	Automatic recovery	Nominal	130% of output current
Output overvoltage protection (OVP)	Overvoltage protection device with latch-up	Automatic recovery	Nominal	130% of output voltage
Over temperature protection (OTP)	Thermal device with hysteresis cycle	Automatic recovery	Nominal	120°C

8- Reliability Data

Characteristics	Conditions	Temperature	Specifications
Mean Time Between Failure (MTBF) According to MIL-HDBK-217F	Ground fixed (Gf)	Case at 40°C Case at 85°C	TBD
	Airborne, Inhabited, Cargo (AIC)	Case at 40°C Case at 85°C	TBD
Mean Time Between Failure (MTBF) According to IEC-62380-TR	Civilian avionics, calculators	Ambient at 55°C 100% time on	TBD

9- Electromagnetic Interference

Electromagnetic Interference requirements according to MIL-STD-461 standards can be easily achieved as indicated in the following section. The following table resumes the different sections covered by these standards.

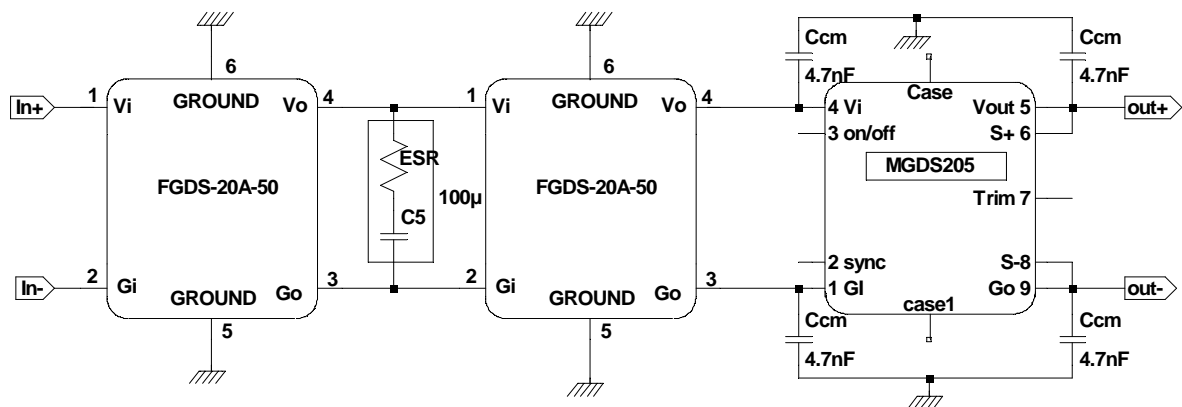

Standard Requirements	MIL-STD-461C Standard	MIL-STD-461D/E Standard	Compliance with GAIA Converter Module & common mode capacitance
Conducted emission (CE) : Low frequency High frequency	CE 01 CE 03	CE 101 CE 102	compliant module stand-alone compliant with additionnal filter
Conducted susceptibility (CS) : Low frequency High frequency	CS 01 CS 02	CS 101 CS114	compliant with additionnal filter compliant with additionnal filter
Radiated emission (RE) : Magnetic field Electrical field	RE 01 RE 02	RE 101 RE 102	compliant module stand-alone compliant module stand-alone
Radiated susceptibility (RS) : Magnetic field Electrical field	RS 01 RS 03	RS 101 RS 103	compliant module stand-alone compliant module stand-alone

9-1 Module Compliance with MIL-STD-461C/D/E Standards

To meet the latest US military standards MIL-STD-461 requirements and in particular the conducted noise emission CE102 requirements, Gaia Converter can propose a stand-alone ready-to-use EMI filter module. This EMI filter module has to be used together with 4 external decoupling capacitance C_c (4,7nF/rated voltage depending on isolation requirement) connected between input and case and output and case.

EMI filter module reference : FGDS-10A-50V or FGDS-20A-50V.

Please consult EMI filter datasheet for further details.

10- Thermal Characteristics

Characteristics	Conditions	Limit or typical	Performances
Operating ambient temperature range at full load	Ambient temperature *	Minimum Maximum	- 40°C see below
Baseplate temperature	Base plate temperature	Minimum Maximum	- 40°C + 105°C
Storage temperature range	Non fonctionning	Minimum Maximum	- 55°C + 125°C
Thermal resistance	Baseplate to ambient Rth(b-a) free air	Typical	11°C/W

Note * : The upper temperature range depends on configuration, the user must ensure a max. baseplate temperature as indicated in following section.

The following discussion will help designer to determine the thermal characteristics and the operating temperature.

Heat can be removed from the baseplate via three basic mechanisms :

- Radiation transfert : radiation is counting for less than 5% of total heat transfert in majority of case, for this reason the presence of radiant cooling is used as a safety margin and is not considered.
- Conduction transfert : in most of the applications, heat will be conducted from the baseplate into an attached heatsink or heat conducting member; heat is conducted thru the interface.
- Convection transfert : convecting heat transfer into air refers to still air or forced air cooling.

In majority of the applications, heat will be removed from the baseplate either with :

- heatsink,
- forced air cooling,
- both heatsink and forced air cooling.

To calculate a maximum admissible ambient temperature the following method can be used.

Knowing the maximum baseplate temperature 105°C of the module, the power used Pout and the efficiency η :

- determine the power dissipated by the module P_{diss} that should be evacuated :

$$P_{diss} = P_{out}(1/\eta - 1) \quad (A)$$

- determine the maximum ambient temperature :

$$T_a = 105^\circ\text{C} - R_{th}(b-a) \times P_{diss} \quad (B)$$

where **Rth(b-a) is the thermal resistance from the baseplate to ambient.**

This thermal Rth(b-a) resistance is the summ of :

- **the thermal resistance of baseplate to heatsink (Rth(b-h))**. The interface between baseplate and heatsink can be nothing or a conducting member, a thermal compound, a thermal pad.... The value of Rth(b-h) can range from 0.4°C/W down to 0.1°C/W for a thermal conductive member interface.
- **the thermal resistance of heatsink to ambient air (Rth(h-a))**, which is depending of air flow and given by heatsink supplier.

The table hereafter gives some example of thermal resistance for different heat transfert configurations.

Heat transfert	Thermal resistance heatsink to air Rth(h-a)	Thermal resistance baseplate to heatsink Rth(b-h)	Global resistance
Free air cooling only	No Heatsink baseplate only : 11°C/W	No need of thermal pad	11°C/W
	AAVID THERMALLOY 241404B91200G 5°C/W	No need of thermal pad	5°C/W
	AAVID THERMALLOY 241409B91200G 3,5°C/W	No need of thermal pad	3,5°C/W
Forced air cooling 200 LFM	No Heatsink baseplate only : 6,9°C/W	No need of thermal pad	6,9°C/W
	AAVID THERMALLOY 241404B91200G 3°C/W	No need of thermal pad	3°C/W
	AAVID THERMALLOY 241409B91200G 1.8°C/W	No need of thermal pad	1.8°C/W

AAVID THERMALLOY is heatsink manufacturers.

10- Thermal Characteristics (continued)

From the two formulas (A) and (B) described in previous page :

$$\bullet P_{diss} = P_{out}(1/\eta - 1) \quad (A)$$

$$\bullet T_a = 105^{\circ}\text{C} - R_{th}(b-a) \times P_{diss} \quad (B)$$

the maximum temperature rise $T_{diss} = R_{th}(b-a) \times P_{diss}$ is a function of thermal resistance R_{th} :

In this specific high power module series, operation without heat removal is not possible as the temperature rise will be over the limit. Conduction transfert via heatsink or chassis is mandatory for operation.

To find a suitable heatsink, the reverse method has to be used from the formula (B) :

$$T_a = 105^{\circ}\text{C} - R_{th}(b-a) \times P_{diss} \quad (B)$$

Knowing the maximum ambient temperature T_a the thermal resistance R_{th} can be calculated to achieve operation and choose the right heatsink.

The curves of efficiency in section 3 will allow this calculation.

MGDS205HC, MGDS205HE case temperature vs output power

10- Thermal Characteristics (continued) : Heatsink Mounting

To mount properly the module to heatsink, some important recommendations need to be taken into account in order to avoid overstressing conditions that might lead to premature failures.

The module case is built with a copper IMS (isolated metallic substrate) crimped on an aluminum frame that provides case rigidity. The IMS surface is the module base plate that need to be reported to heat sink to achieve proper cooling. If for some reasons like poor module report, the IMS base plate is subject to mechanical overstress, module's electrical characteristics may be definitely affected.

A typical example of damageable report is the use of thick thermal interface with usual screwing torque applied on mounting screws. This combination causes a high pressure on baseplate center due to thermal interface material compression. The final consequence is a slight IMS bending that can conduct for the module to fail high voltage isolation leading to heavy electrical damage on internal circuit.

The good practice is to respect the 4 following recommendations:

- do not exceed recommended screwing torque of 0,7 N.m (6 lbs.in)
- prefer thin thermal pad with thickness lower than 0,34 mm (0.015").
GAIA Converter recommends to use thin thermal pads instead of thermal compound like grease.
- take care to reflow module leads only when all assembly operations are completed.
- do not report module on surfaces with poor flatness characteristics. GAIA Converter recommends not to overflow 0,1mm/m for the surface flatness.

Gaia converter suggests to follow the procedure hereunder for the mechanical assembly procedure in order to avoid any stress on the pins of the converters. It is good practice to be sure to mount the converters first mechanically, then solder the units in place.

1. Choice of the thermal gap pad : its shape must be the same as the module. The dimensions of the gap pad can be a little larger than the module.

2. Screw the converter to the heatsink and/or to the board. The four screws have to be screwed in a "X" sequence.

- Lightly finger-tighten all screws and run several «X» sequences before achieving final torque to get homogeneous tightening.
- Torque screws from 0,35 N.m (3 lbs.in) to 0,7 N.m (6 lbs.in).

3. Screw the heatsink to the board.

4. Solder the pins of the converters on the board.

This sequence avoids mechanical stresses on the converters that could lead to stress internal components or assemblies and cause their failures.

11- Environmental Qualifications

The modules have been subjected to the following environmental qualifications.

Characteristics	Conditions	Severity	Test procedure
Climatic Qualifications			
Life at high temperature	Duration Temperature / status of unit	Test D : 1 000 Hrs @ 105°C case, unit operating @ 125°C ambient, unit not operating	MIL-STD-202G Method 108A
Altitude	Altitude level C Duration Climb up Stabilization Status of unit	40 000 ft@-55°C 30 min. 1.000 ft/min to 70 000 ft@-55°C, 30 min. unit operating	MIL-STD-810E Method 500.3
Humidity cyclic	Number of cycle Cycle duration Relative humidity variation Temperature variation Status of unit	10 Cycle I : 24 Hrs 60 % to 88 % 31°C to 41°C unit not operating	MIL-STD-810E Method 507.3
Humidity steady	Damp heat Temperature Duration Status of unit	93 % relative humidity 40°C 56 days unit not operating	MIL-STD-202G Method 103B
Salt atmosphere	Temperature Concentration NaCl Duration Status of unit	35°C 5 % 48 Hrs unit not operating	MIL-STD-810E Method 509.3
Temperature cycling	Number of cycles Temperature change Transfert time Steady state time Status of unit	200 -40°C / +85°C 40 min. 20 min. unit operating	MIL-STD-202A Method 102A
Temperature shock	Number of shocks Temperature change Transfert time Steady state time Status of unit	100 -55°C / +105°C 10 sec. 20 min. unit not operating	MIL-STD-202G Method 107G
Mechanical Qualifications			
Vibration (Sinusoidal)	Number of cycles Frequency / amplitude Frequency / acceleration Duration Status of unit	10 cycles in each axis 10 to 60 Hz / 0.7 mm 60 to 2 000 Hz / 10 g 2h 30 min. per axis unit not operating	MIL-STD-810D Method 514.3
Shock (Half sinus)	Number of shocks Peak acceleration Duration Shock form Status of unit	3 shocks in each axis 100 g 6 ms 1/2 sinusoidal unit not operating	MIL-STD-810D Method 516.3
Bump (Half sinus)	Number of bumps Peak acceleration Duration Status of unit	2 000 Bumps in each axis 40 g 6 ms unit not operating	MIL-STD-810D Method 516.3

12- Description of Protections

The converter series includes 4 types of protection devices that are powered and controlled by a fully independent side power stage.

12-1 Input Undervoltage Lockout (UVLO)

12-1-1 Undervoltage Lockout (UVLO)

An undervoltage protection will inhibit the module when input voltage drops below the lockout turn-off threshold (see section 4 for value) and restores to normal operation automatically when the input voltage rises the lockout turn-on threshold.

12-2 Output Over Current Protection (OCP)

The converter series incorporates an over-current protection circuit. The over-current protection detects shorts circuit or over current and protects the module according to the hiccup graph. The maximum detection current I_d is depending on input voltage V_{in} , temperature, and is higher than 105 % maximum nominal output current.

When OCP is triggered, the converter falls in hiccup mode by testing periodically if the overload is still present. The module restart automatically to normal operation when over-current is removed. T_d (detection time) and T_h (hiccup period) are depending on V_{in} and temperature. In hiccup mode the average current is around 25 % of I_{nom} .

12-3 Output Overvoltage Protection (OVP)

Each circuit has an internal overvoltage protection circuit that monitors the voltage across the output power terminals. It is designed to turn the converter off at 130% (+/-5%) of output voltage.

Once in OVP protection, the module will restart automatically when overvoltage is removed.

12-4 Over Temperature Protection (OTP)

A thermal protection device adjusted at 120°C (+/-5%) internal temperature with 10°C hysteresis cycle will inhibit the module as long as the overheat is present and restores to normal operation automatically when overheat is removed. The efficiency of the OTP function is warranty with the module mounted on a heatsink.

13- Description of Functions

13-1 Trim Function

The output voltage V_o may be trimmed in a range of $\pm 10\%$ of the nominal output voltage via a single external trimpot or fixed resistor.

Trim Up Function

Do not attempt to trim the module higher than 10% of nominal output voltage as the overvoltage protection may occur.

Also do not exceed the maximum rated output power when the module is trimmed up.

The trim up resistor must be connected to S+ pin.

The trim up resistance must be calculated with the following formula :

$$R_u = \frac{R_1 (V_o - V_{ref}) V_{0nom}}{(V_o - V_{0nom}) V_{ref}} - R_1 - R_2$$

Trim Down Function

Do not trim down more than -10% of nominal output voltage.

The available output power is reduced by the same percentage that output voltage is trimmed down.

The trim down resistor must be connected to S- pin.

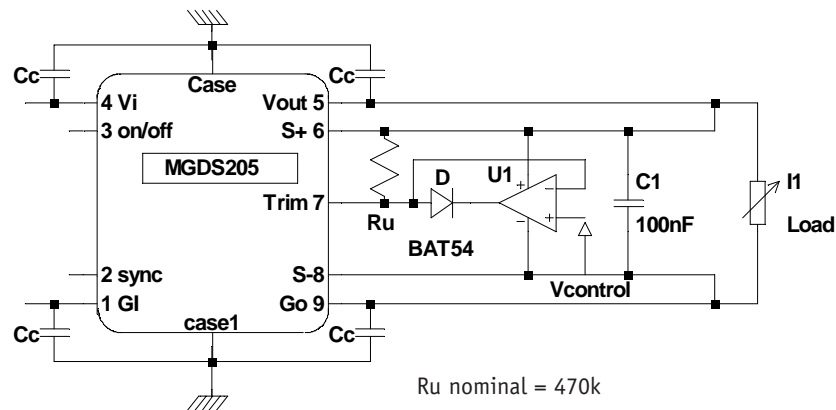

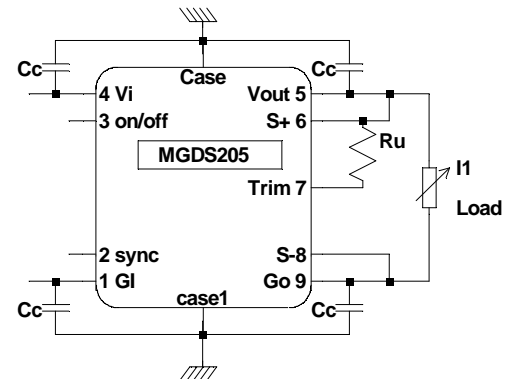

The trim down resistance must be calculated with the following formula :

$$R_d = \frac{(R_2 + R_1) V_o - R_2 V_{0nom}}{V_{0nom} - V_o}$$

Trim via a voltage

The output voltage is given by the following formula :

$$V_o = 1 + \frac{R_1}{(R_1 + R_2)} \frac{(V_{cont} - 1)}{V_{ref}}$$

Parameter	Unit	Min.	Typ.	Max.
Trim reference	Vdc	2.45	2.5	2.55
Resistor R1	Ohm	/	3 900	/
Resistor R2	Ohm	/	13 000	/

13- Description of Functions (continued)

13-2 Sense Function

If the load is separated from the output by any line length, some of these performance characteristics will be degraded at the load terminals by an amount proportional to the impedance of the load leads. Sense connections enable to compensate the line drop at a maximum of 10% of output voltage. Connection is described in figure herein.

13-3 On/Off Function

The control pin 3 (On/Off) can be used for applications requiring On/Off operation. This may be done with an open collector transistor, a switch, a relay or an optocoupler. Several converters may be disabled with a single switch by connecting all

On/Off pins together.

- The converter is disabled by pulling low the pin 3.
- No connection or high impedance on pin 3 enables the converter.

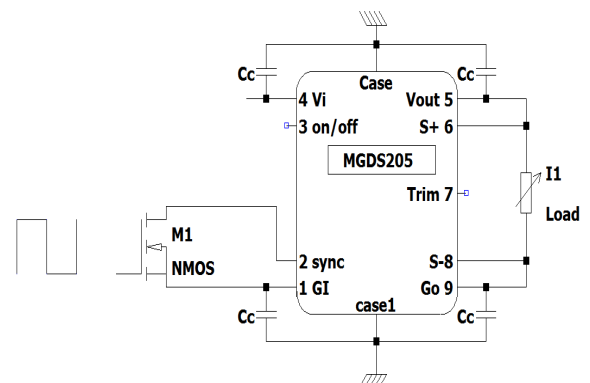

By releasing the On/Off function, the converter will restart within the start up time specifications given in table section 3. For further details please consult "Logic On/Off" application note.

Parameter	Unit	Min.	Typ.	Max.	Notes, conditions
On/Off module enable voltage	Vdc	3,5	/	5	Open, the switch must not sink more than 50μA
On/Off module disable voltage	Vdc	0	/	0.5	The switch must be able to sink 0,5 mA
On/Off module enable delay	ms	/	/	30	The module restarts with the same delay after alarm mode removed
On/Off module disable delay	μs	/	/	100	Vi nominal, full load

13-4 Synchronization Function

The «Sync» pin allows the synchronization of a module to an external frequency source or to another MGDM-205 module. The pin is bidirectionnal and must be driven by an open drain circuitry providing a square wave signal (active on falling edge) with a frequency ranging between 330kHz to 370kHz. The characteristics of the signal are detailed in the table hereunder. (t_r , $t_f < 20\text{ns}$; $100\text{ns} < T_p < 400\text{ns}$)

14- Application Notes

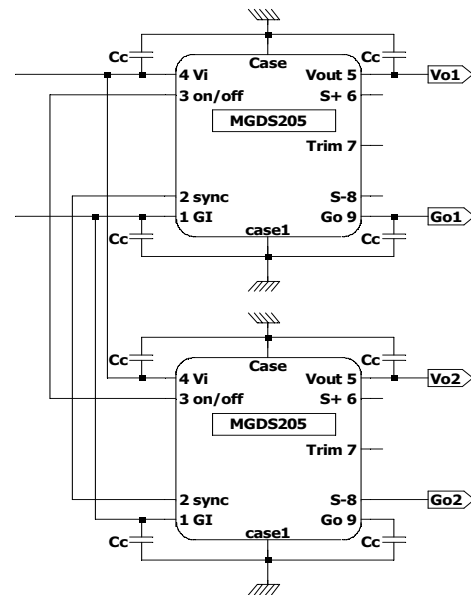

14-1 Synchronization of Modules

The MGDM-205 series provides a synchronization function through the pin 2 (Synchro) to enable automatic synchronization between several converters.

If several converters are used, they lock themselves into the highest switching frequency.

The synchronization signal available on pin 2 is referenced to ground in (Gi). It is a rectangular signal with 4 Vp (+/- 0.5V) amplitude with an input impedance of 4,7 KOhm.

The conductor that connects all synchro signals need to be preserved from noise to be efficient.

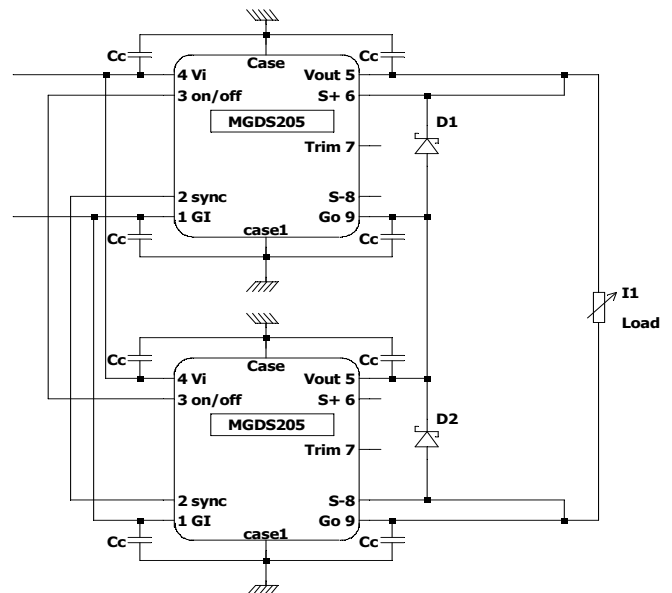

14-2 Connection of Modules in Series

The output of single output units can be connected in series without any precautions to provide higher output voltage level.

Nevertheless, GAIA Converter recommends to protect each individual output by a low power shottky diode rated with the maximum current of the converter to avoid reverse polarity at any output.

Reverse polarity may occur at start up if the output voltages do not rise at the same time.

15- Dimensions

Dimensions are given in mm (inches). Tolerance : +/- 0,2 mm (+/- 0.01 ") unless otherwise indicated.
Weight : 85 grams (3 Ozs) max.

16- Materials

Frame : Aluminium alodined coating.
Baseplate : Copper with gold finishing.
Pins : Flash gold plating over nickel underplate.

17- Product Marking

Side face : Company logo, location of manufacturing.
: Module reference : MGDx-205-»X»-»Y».
Date code : year and week of manufacturing, suffix, /option.
